

Requirements that cannot be represented in the EERD:

1. Temporal Overlap Prevention

The requirement "a vehicle may only be assigned to one driver at any given time" cannot be modeled. The EERD shows the 1:N relationship between VEHICLE and ASSIGNMENT but cannot express that time ranges (start_time to end_time) must not overlap for assignments of the same vehicle.

2. Subtype-Specific Relationships

The requirement "for cars only, a fuel log..." cannot be enforced if the relationship is modeled from VEHICLE. The EERD cannot prevent SCOOTER or BIKE from having fuel logs. The relationship must be drawn directly from CAR to FUEL_LOG, which is shown in the diagram.

3. Cross-Entity Consistency

A DELIVERY references both a DRIVER and a VEHICLE independently. However, the EERD cannot express that this DRIVER-VEHICLE combination must correspond to a valid ASSIGNMENT at the time of the delivery. The two relationships (DRIVER-ASSIGNMENT-VEHICLE and DRIVER-DELIVERY-VEHICLE) are independent in the EERD.
